EP 0 259 780 B1

Description

Antibiotic A/16686 is a depsipeptidic substance isolated from a culture of *Actinoplanes* sp. ATCC 33076.

This substance, which is mainly active against gram positive bacteria, has been described in U.S. patent 4,303,646 together with the process for obtaining it and the corresponding pharmaceutical compositions.

It was then found that three closely related components could be isolated from antibiotic A/16686 which were named factor A₁, A₂ and A₃. Factor A₂ is the component obtained in a preponderant amount and is the most relevant for the biological activity, while factors A₁ and A₃ are obtained in a minor amount. These substances as well as their preparation and uses are described in U.S. patent 4,427,656.

Due to the increasing development of tolerance and even resistance to current antibiotic treatments, the need for new antibiotic substances is still high.

Particularly desirable are antibiotics in single isolated form or complex with very well defined and standardized composition.

One object of the invention is therefore a method for selectively enhancing the production of factors A₂ and/or A₃ of antibiotic A/16686 either to isolate these single components or to enrich the complex in one or both of the above components, which comprises adding an appropriate precursor of the desired antibiotic factor to an A/16686 producing culture during fermentation.

According to the method of the invention, it is in fact possible, for instance, to modulate the ratio of the single major components of antibiotic A/16686 complex in large scale industrial fermentation. This method therefore represents a useful tool to adjust the composition of the final product to adhere to standard specifications.

Moreover, by following the procedure of the invention it is also possible to obtain, directly from the fermentation mass of the producing strain, a crude product very rich in antibiotic A/16686 factor A₂ which can then be isolated in a pure form with higher yields and less time consuming steps.

The appropriate precursor for increasing the ratio of factor A₂ in antibiotic A/16686 complex is selected from leucine, its salts with acids and bases which are non-toxic to the producing microorganism, isovaleric acid, its salts with bases which are non-toxic to the producing microorganism, its esters with mono- and poly-hydroxy lower alkanols, alpha-keto-isocaproic acid, its salts with bases which are non-toxic to the producing microorganism, its esters with mono- and poly-hydroxy lower alkanols, isoamyl alcohol and its esters with acids which are non-toxic to the producing microorganism.

The appropriate precursor for increasing the ratio of factor A₃ in antibiotic A/16686 complex is selected from valine, its salts with acids and bases which are non-toxic to the producing microorganism, alpha-keto-isovaleric acid, its salts with bases which are non-toxic to the producing microorganism, its esters with mono- and poly-hydroxy lower alkanols, isobutyric acid, its salts with bases which are non-toxic to the producing microorganism, its esters with mono- and poly-hydroxy lower alkanols, isobutanol and its esters with acids which are non-toxic to the producing microorganism.

Salts with bases which are non-toxic to the microorganism are salts wherein the type and concentration of the given cation is such that it does not impair either the growth of the microorganism culture or the production of the desired antibiotic substance to a considerable extent at the concentration employed in the fermentation mass. Examples of said cations are those from alkali metals and alkaline earth metals such as sodium, potassium, calcium or magnesium, as well as those from amines, such as ammonium, primary, secondary or tertiary (C₁-C₄)alkyl ammonium and hydroxy(C₁-C₄)alkyl ammonium. Preferred salts are those with sodium, potassium or ammonium ions.

Examples of salts with acids which are non-toxic to the producing microorganism, i.e. salts with acids which do not either impair considerably the growth of the microorganism culture or the production of the desired antibiotic substance, at the concentration at which they are present in the fermentation mass, are salts with preferably mineral acids such as hydrochloric acid, even if also organic acids may, in some instances, be present.

Esters of an appropriate precursor as defined above with mono- and poly-hydroxy lower alkanols are esters with (C₁-C₆)alkanols with 1, 2, 3, 4, 5 or 6 hydroxy functions per molecule. When (C₁-C₄)alkanols are used, they must be different from those which act as precursors for the other antibiotic factor (i.e. isobutanol or isoamyl alcohol) unless concomitant increase of both factors is desired.

Preferred examples of poly-hydroxy alkanols are glycerol and propylene glycol.

When the lower alkanol may be present in different enantiomeric and epimeric forms, in the present description and claims, each single form separately as well as the mixture of said single forms in any proportion is intended.

Esters of an appropriate hydroxy containing precursor as defined above which are non-toxic to the microorganism are (C₂-C₂₂)alkanoyl esters wherein the type and concentration of the alkanoyl moiety in the fermentation medium is such that it does not impair the growth of the microorganism culture or the production of the desired antibiotic substance to a considerable extent. In general, straight chain (C₂-C₄)-alkanoyl esters are preferred.

An antibiotic A/16686 producing culture is a culture of a strain like *Actinoplanes* sp. ATCC 33076, or a producing mutant or variant thereof, which is capable, upon cultivation, of producing recoverable amounts of antibiotic A/16686.

The method of the invention includes cultivating an antibiotic A/16686 producing culture in an aqueous nutrient culture medium containing an assimilable source of carbon, an assimilable source of nitrogen and inorganic salts under the usual conditions known for the cultivation of *Actinoplanes* in general and for the A/16686 producing ones in particular (c.f. U.S. 4,303,646, cited above), and adding an effective amount of the appropriate precursor to selectively enhance the production of antibiotic A/16686 factor A₂ and/or factor A₃.

The appropriate precursor may be added to the fermentation in a continuous or discontinuous way during fermentation or may be added to the cultivation medium before fermentation. It may be added directly, if suitably fluid at the fermentation temperature, or it may be added as a solution, suspension or emulsion, and preferably it is an aqueous solution or suspension.

An "effective amount" of the appropriate precursor means an amount of precursor as defined above which, when added to the fermentation, gives a concentration of a selective precursor sufficient to produce the selective increase of the specific factor of antibiotic A/16686, without causing toxic effects to the growing culture of the producing microorganism.

The rate of addition of the precursor must be high enough to increase the yield of the desired factor to a considerable or optimum extent without however producing a toxic effect on the fermentation.

In general, it may be useful to feed an effective amount of the appropriate precursor in continuous or portionwise during the production stage of the fermentation.

Following fermentation, if desired, antibiotic A/16686 complex or the single factor A₂ or A₃ can be recovered according to the known procedures or obvious modifications thereof.

The nutrient fermentation media suitable for the fermentation of the A/16686 producing strain which can be used in the method of the invention, usually contain: a suitable carbon source which, for instance, may be selected from sugars (e.g. glucose, sucrose, maltose), polysaccharides (e.g. starch, dextrane), polyalcohols (e.g. glycerol, propylene glycol); suitable nitrogen sources which, for instance, may be selected from ammonium salts, asparagine, peanut meal, soybean meal, meat extract, tryptone, peptone, yeast hydrolyzate, yeast extract and corn steep liquor; and inorganic salts. Among the inorganic salts which can be incorporated in the culture media there are the customary soluble salts capable of yielding sodium, potassium, iron, zinc, cobalt, magnesium, calcium, ammonium, chloride, carbonate, sulphate, phosphate, nitrate and the like ions.

Ordinarily, the antibiotic-producing strain is pre-cultured in a shake flask, then the culture is used to inoculate jar fermentors for production of substantial quantities of the antibiotic substances. The medium used for the pre-culture can be the same as that employed for larger fermentations, but other media can also be employed.

The fermentation is carried out for a time varying from 50 to 150 hours under submerged aerobic conditions at a temperature between 25°C and 35°C, preferably between 27°C and 33°C. The addition of the selectively effective amount of appropriate precursors can be made to the fermentative media before inoculation of the producing strain, however, it is preferably made 24 to 48 hours after the fermentation is started. The addition may be made in one or several portions or in a continuous way.

According to a typical experiment embodying this invention, a culture of the A/16686 producing strain, maintained on oat-meal agar slants, is inoculated into a flask containing 100 ml of a vegetative medium. After 36 hours, samples of the culture (5 milliliters) are used to inoculate a series of fermentation flasks containing 100 ml of fermentative medium. After 24 to 48 hours of fermentation, the selectively effective amount of precursor is added as appropriate. If concomitant increase of two factors of A/16686 complex is desired, the two appropriate precursors are added to the same fermentation flask. The fermentation is continued for additional 60 to 150 hours, then the fermentation cake is removed and samples of the broth are analyzed by HPLC.

The recovery of the antibiotic substances may be carried out as known in the art.

For veterinary application, the whole fermentation cake or concentrated broth can be used.

The addition of the precursor to the fermentation is such that it does not affect considerably its predetermined pH range. Thus, for instance, when free acid precursors are added directly to the medium,

the pH is maintained under control by buffering the medium or by immediate neutralization with bases which are non-toxic to the microorganism.

When the precursor to be added is an aminoacid, it may be supplied to the fermentation as an aqueous solution of its salts with acids or bases which are non-toxic to the producing microorganism, e.g. hydrochlorides and sodium salts, even if in many instances the aminoacid may conveniently be added as a solution of the "internal salt". Both racemic mixtures and optically active isomers can be used as precursors.

However, in general, the addition of the L-form gives higher yields than the corresponding D-form.

A preferred embodiment of the process of this invention is therefore represented by the use of the L-form of the aminoacid precursor for enhancing the concentration of factor A₃ (L-valine, a salt or an ester thereof), and/or factor A₂ (L-leucine, a salt or an ester thereof) of antibiotic A/16686 complex. According to this preferred embodiment, it is also possible to increase the percentage of factor A₂ in the fermentation product over 80% of the complex.

With lower alkanolic acid precursors (isobutyric acid, isovaleric acid, alpha-keto-isovaleric acid, and alpha-keto-isocaproic acid) the addition may be made through an aqueous solution of their salts with non-toxic bases; ammonium and sodium salts are usually preferred.

When esters of the above lower alkanolic acids and unsaturated fatty acids with mono-hydroxy lower alkanols are employed as precursors, said esters are usually derived from methanol, ethanol and propanol, although ester with C₄-C₆ alkanols may also be employed. In this case, the C₄-C₆ alkanol must be different from that which may act as precursor for the other factor, (isobutanol or isoamyl alcohol), unless concomitant increase of the other factor is desired.

Alkanol precursors such as isobutanol and isoamyl alcohol are usually added as such to the fermentation. However, they can be supplied also as esters of acids which are non-toxic to the microorganism. These acids must be different from those which may act as precursors for the other A/16686 factor unless concomitant increase of the other factor is desired. Usually, esters with linear (C₂-C₄) alkanolic acids such as acetic, propionic and butyric acid are preferred.

The "selectively effective amount" to be added to the fermentation medium according to this invention depends on the type of precursor. Usually, with the esters of the lower alkanolic acids (isobutyric acid, isovaleric acid) amounts that yield a concentration of the acid into the fermentation medium ranging between 0.1 g/l and 5 g/l are employed, with the range between 0.1 g/l and 1 g/l being preferred. With lower alkanols (isobutanol, isoamyl alcohol) or their esters with acids which are non-toxic to the microorganism, amounts that yield a concentration of the alcohol ranging between 0.5 g/l and 5 g/l are usually employed, with the range between 1 g/l and 2 g/l being preferred.

With the aminoacids (valine, leucine) and the keto-acids (alpha-keto-isovaleric acid, alpha-keto-isocaproic acid) or their salts with acids and bases the "selectively effective amount" added to the fermentation medium usually ranges between 0.2 g/l and 5 g/l, and preferably between 0.5 g/l and 4 g/l; the most preferred range being between 2 and 4 g/l.

In the case where the lower alkanolic acids (e.g. isobutyric acid, isovaleric acid), or their salts are directly added to the fermentation medium, the "selectively effective amount" usually ranges between 0.1 g/l and 2.5 g/l, with the range between 0.3 g/l and 1.5 g/l being preferred.

Concentrations higher than those indicated above may still be effective in enhancing the relative percentage of one of the A/16686 factors but, in general, the overall yield is depressed because of toxic effects on the culture.

A further object and preferred embodiment of the invention is represented by a method for enhancing the production of antibiotic A/16686 complex, antibiotic A/16686 factor A₂ or factor A₃ which comprises adding a butanoic acid derivative or precursor that can release butanoic acid under the fermentation conditions, to an A/16686 producing culture.

In fact, it has been surprisingly found that the selective enhancement of the production of an A/16686 factor according to the method of the invention is further increased if a butanoic acid derivative or precursor is added in conjunction with the appropriate precursor of an A/16686 factor.

Preferred examples of butanoic acid derivatives or precursors are (C₁-C₆)alkyl esters, mono- and poly-hydroxy alkyl esters.

Particularly preferred are ethyl butyrate and tri-butyryne.

When dealing with the addition of any substance to the fermentation medium and, in particular, when dealing with the addition of an appropriate precursor and butanoic acid or a derivative or precursor thereof, the term "in conjunction" encompasses the addition of the substances referred to simultaneously or sequentially (one after the other and vice versa) at an interval such that the combined effects of the added substances can still manifest themselves on the fermentation.

Obviously, the present definition encompasses also the case in which one or both substances added "in conjunction" have been previously added to the culture medium or are already present in it.

Generally, a butanoic acid derivative or precursor is added in an amount that yields a concentration of the acid in the fermentation medium from 0.5 g/l to 2 g/l.

5 The yields in antibiotic complex are in general considerably increased and when the proper precursor is also added, the percentage of the given antibiotic factor may be increased to about 95-98%.

Particularly preferred is the method for preparing antibiotic A/16686 factor A₂ with high yields and purity which comprises adding leucine, and most preferably L-leucine, in conjunction with tri-butyryne or ethyl butyrate to an A/16686 producing culture, during fermentation.

10 The following examples describe in further detail some specific embodiments of the method of the invention.

Example 1

15 An oatmeal agar slant of *Actinoplanes* sp. ATCC 33076 is inoculated into a 500 ml flask containing 100 ml of the following vegetative medium (g/l):

20	Soybean meal	13
	Glucose	12
	Starch	13
	CaCO ₃	4

25 After 36 h on a rotary shaker at 28-30°C, 5 ml of the culture are used to inoculate 500 ml flasks containing 100 ml of the following fermentation medium (g/l):

30	Soybean meal	30
	Glycerol	20
	Starch	4
	Glucose	4
	Maltose	20
	Sucrose	20
	CaCO ₃	6

35 After cultivating at 28-30°C on a rotary shaker for 24 h, the appropriate precursor is added. After 90-96 h of cultivation, the fermentation cake is removed by centrifuge and the broth is analyzed for its content in antibiotic A/16686 factors according to the following HPLC method:

40 a. Separation by gradient reverse phase partition

Instrument:	pump Varian 5000 A; detector Varian at 254 nanometer injector: Rheodyne model 7125; integrator: Spectra Physics model 4000;
45 Column:	silanized silica gel; Brownlee Lab. RP 18 Spheri 5
Mobile phase:	0.05 M NaH ₂ PO ₄ /acetonitrile, 65:35, pH 6
Flow rate:	1.8 ml/min
Injection:	20 microliter
50 Operative conditions:	isocratic conditions
Retention times:	A/16686 factor A ₁ 6.69 min A/16686 factor A ₂ 10.16 min A/16686 factor A ₃ 16.29 min

55 b. Percentage distribution

The components are separated by the above procedure and their relative distribution is obtained as a percent of the total of the three peaks by the area percentage method. The results of representative

experiments are reported below:

5	Precursor addition (g/l)	Total yield mg/l	% Factor A ₁	% Factor A ₂	% Factor A ₃

lower alkanols, alpha-keto-isocaproic acid, its salts with bases which are non-toxic to the producing microorganism, its esters with mono- and poly-hydroxy lower alkanols, isoamyl alcohol and its esters with acids which are non-toxic to the producing microorganism and the appropriate precursor for increasing the ratio of factor A₃ in antibiotic A/16686 complex is selected from valine, its salts with acids and bases which are non-toxic to the producing microorganism, alpha-keto-isovaleric acid, its salts with bases which are non-toxic to the producing microorganism, its esters with mono- and poly-hydroxy lower alkanols, isobutyric acid, its salts with bases which are non-toxic to the producing microorganism, its esters with mono- and poly-hydroxy lower alkanols, isobutanol and its esters with acids which are non-toxic to the producing microorganism.

10

2. A process as claimed in claim 1 wherein the appropriate precursor added is valine or its salts with acids and bases non-toxic to the microorganism and the respective selectively effective amount ranges between 0.2 g/l and 5 g/l, preferably between 0.5 g/l and 4 g/l.

15

3. A process as claimed in claim 1 wherein the appropriate precursor added is isobutyric acid or its salts with bases non-toxic to the microorganism and the respective selectively effective amount ranges between 0.1 g/l and 2.5 g/l, preferably between 0.3 g/l and 1.5 g/l.

20

4. A process as claimed in claim 1 wherein the appropriate precursor added is an ester of isobutyric acid with a mono- or poly-hydroxy lower alkanol and the respective selectively effective amount ranges between 0.1 g/l and 5 g/l, preferably between 0.1 g/l and 1 g/l.

25

5. A process as claimed in claim 1 wherein the appropriate precursor added is isobutanol or its esters with acids non-toxic to the microorganism and the respective selectively effective amount ranges between 0.5 g/l and 5 g/l, preferably between 1 g/l and 2 g/l.

30

6. A process as claimed in claim 1 wherein the appropriate precursor added is leucine or its salts with acids and bases non-toxic to the microorganism and the respective selectively effective amount ranges between 0.2 g/l and 5 g/l, preferably between 0.5 g/l and 4 g/l.

35

7. A process as claimed in claim 1 wherein the appropriate precursor added is isovaleric acid or its salts with bases non-toxic to the microorganism and the respective selectively effective amount ranges between 0.1 g/l and 2.5 g/l, preferably between 0.3 g/l and 1.5 g/l.

40

8. A process as claimed in claim 1 wherein the appropriate precursor added is an ester of isovaleric acid with a mono- or poly-hydroxy lower alkanol and the respective selectively effective amount ranges between 0.1 g/l and 5 g/l, preferably between 0.1 g/l and 1 g/l.

9. A process as claimed in claim 1 wherein the appropriate precursor added is isoamyl alcohol or its esters with acids non-toxic to the microorganism and the respective selectively effective amount ranges between 0.5 g/l and 5 g/l, preferably between 1 g/l and 2 g/l.

45

10. A process as claimed in claim 1 wherein the appropriate precursor added is alpha-keto-isocaproic acid, its salts with bases non-toxic to the microorganism, or its esters with mono- or poly-hydroxy lower alkanols and the respective selectively effective amount ranges between 0.2 g/l and 5 g/l, preferably between 0.5 g/l and 4 g/l.

50

11. A process as claimed in claim 1, 2, 3, 6, 7, or 10 wherein the salts with bases non-toxic to the microorganism are sodium or ammonium salts.

55

12. A process as claimed in claim 1, 4, 8 or 10 wherein the ester is an ester with one of the following alkanols: methanol, ethanol, propanol, ethylene glycol and glycerol.

13. A process as claimed in claim 1, 2 or 6 wherein the aminoacid is in the L- form.

14. A process as claimed in claim 1, 2 or 6 wherein the salt with an acid non-toxic to the microorganism is the hydrochloride or the sulfate.

15. A process as claimed in any one of the claims 1, 5 or 9 wherein the ester with an acid non-toxic to the microorganism is an ester with one of the following acids: acetic acid, propionic acid and butyric acid.
16. A process as claimed in any one of the preceding claims wherein the strain is Actinoplanes sp. ATCC 33076.
17. A process as claimed in any one of the preceding claims wherein the fermentation is carried out at a temperature between 25 °C and 35 °C, and preferably between 27 °C and 33 °C.
18. A process as claimed in any one of the preceding claims wherein the addition of the appropriate precursor is carried out 24 to 48 hours after the fermentation is started.
19. In a process of claims 1 to 18 the further improvement of adding an effective amount of a precursor or derivative of butanoic acid in conjunction with the proper precursor of A/16686 factor A₂ or A₃.
20. A process for increasing the production of antibiotic A/16686 complex which comprises adding to a culture of an Actinoplanes sp. ATCC 33076 or a producing mutant thereof an effective amount of a precursor or derivative of butanoic acid.

20 Patentansprüche

1. Verfahren zur Herstellung eines in seinen Faktoren A₂ und/oder A₃ angereicherten A/16686-Komplexes, umfassend die Zugabe einer selektiv wirksamen Menge einer geeigneten Vorstufe zu einer Kultur von Actinoplanes sp. ATCC 33076 oder einer A/16686 produzierende Mutante davon, wobei die geeignete Vorstufe zur Erhöhung des Verhältnisses von Faktor A₂ im Antibiotikum A/16686-Komplex ausgewählt ist aus Leucin, dessen Salzen mit Säuren und Basen, die für den produzierenden Mikroorganismus nicht toxisch sind, Isovaleriansäure, deren Salzen mit Basen, die für den produzierenden Mikroorganismus nicht toxisch sind, deren Estern mit Mono- und Polyhydroxyniederalkanolen, α-Keto-isocaproinsäure, deren Salzen mit Basen, die für den produzierenden Organismus nicht toxisch sind, deren Estern mit Mono- und Polyhydroxyniederalkanolen, Isoamylalkohol und dessen Estern mit Säuren, die für den produzierenden Mikroorganismus nicht toxisch sind, und die geeignete Vorstufe zur Erhöhung des Verhältnisses von Faktor A₃ im Antibiotikum A/16686-Komplex ausgewählt ist aus Valin, dessen Salzen mit Säuren und Basen, die für den produzierenden Mikroorganismus nicht toxisch sind, α-Ketoisovaleriansäure, deren Salzen mit Basen, die für den produzierenden Mikroorganismus nicht toxisch sind, deren Estern mit Mono- und Polyhydroxyniederalkanolen, Isobuttersäure, deren Salzen mit Basen, die für den produzierenden Mikroorganismus nicht toxisch sind, deren Estern mit Mono- und Polyhydroxyniederalkanolen, Isobutanol und dessen Estern mit Säuren, die für den produzierenden Mikroorganismus nicht toxisch sind.
2. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe Valin ist oder deren Salze mit Säuren und Basen, die für den Mikroorganismus nicht toxisch sind, und die entsprechende selektiv wirksame Menge im Bereich zwischen 0,2 g/l und 5 g/l, vorzugsweise zwischen 0,5 g/l und 4 g/l liegt.
3. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe Isobuttersäure ist oder deren Salze mit Basen, die für den Mikroorganismus nicht toxisch sind, und die betreffende selektiv wirksame Menge im Bereich zwischen 0,1 g/l und 2,5 g/l, vorzugsweise zwischen 0,3 g/l und 1,5 g/l liegt.
4. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe ein Ester der Isobuttersäure mit einem Mono- oder Polyhydroxyniederalkanol ist, und die entsprechende selektiv wirksame Menge im Bereich zwischen 0,1 g/l und 5 g/l, und vorzugsweise zwischen 0,1 g/l und 1 g/l liegt.
5. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe Isobutanol ist oder dessen Ester mit Säuren, die für den Mikroorganismus nicht toxisch sind, und die betreffende selektiv wirksame Menge im Bereich zwischen 0,5 g/l und 5 g/l, vorzugsweise zwischen 1 g/l und 2 g/l liegt.
6. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe Leucin ist oder dessen Salze mit Säuren und Basen, die für den Mikroorganismus nicht toxisch sind, und die betreffende selektiv wirksame Menge im Bereich zwischen 0,2 g/l und 5 g/l, vorzugsweise zwischen 0,5 g/l und 4 g/l liegt.

7. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe Isovaleriansäure ist oder deren Salze mit Basen, die für den Mikroorganismus nicht toxisch sind, und die entsprechende selektiv wirksame Menge im Bereich zwischen 0,1 g/l und 2,5/l, vorzugsweise zwischen 0,3 g/l und 1,5 g/l liegt.
- 5 8. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe ein Ester der Isovaleriansäure mit einem Mono- oder Polyhydroxyniederalkanol ist und die entsprechende selektiv wirksame Menge im Bereich zwischen 0,1 g/l und 5 g/l, vorzugsweise zwischen 0,1 g/l und 1 g/l liegt.
9. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe Isoamylalkohol ist oder dessen
10 Ester mit Säuren, die für den Mikroorganismus nicht toxisch sind, und die entsprechende selektiv wirksame Menge im Bereich zwischen 0,5 g/l und 5 g/l, vorzugsweise zwischen 1 g/l und 2 g/l liegt.
10. Verfahren nach Anspruch 1, wobei die zugegebene geeignete Vorstufe α -Keto-isocaproinsäure, deren Salze mit Basen, die für den Mikroorganismus nicht toxisch sind, oder deren Ester mit Mono- oder
15 Polyhydroxyniederalkanolen ist, und die entsprechende selektiv wirksame Menge im Bereich zwischen 0,2 g/l und 5 g/l, vorzugsweise zwischen 0,5 g/l und 4 g/l liegt.
11. Verfahren nach Anspruch 1, 2, 3, 6, 7 oder 10, wobei die Salze mit Basen, die für den Mikroorganismus nicht toxisch sind, Natrium- oder Ammoniumsalze sind.
20
12. Verfahren nach Anspruch 1, 4, 8 oder 10, wobei der Ester ein Ester der nachstehenden Alkanole ist: Methanol, Ethanol, Propanol, Ethylenglykol und Glycerin.
13. Verfahren nach Anspruch 1, 2 oder 6, wobei die Aminosäure in der L-Form vorliegt.
25
14. Verfahren nach Anspruch 1, 2 oder 6, wobei das Salz mit einer Säure, die für den Mikroorganismus nicht toxisch ist, das Hydrochlorid oder das Sulfat ist.
15. Verfahren nach einem der Ansprüche 1, 5 oder 9, wobei der Ester mit einer Säure, die nicht-toxisch für
30 den Mikroorganismus ist, ein Ester mit einer der nachstehenden Säuren ist: Essigsäure, Propionsäure und Buttersäure.
16. Verfahren nach einem der vorangehenden Ansprüche, wobei der Stamm Actinoplanes sp. ATCC 33076 ist.
35
17. Verfahren nach einem der vorangehenden Ansprüche, wobei die Fermentation bei einer Temperatur zwischen 25 °C und 35 °C, vorzugsweise zwischen 27 °C und 33 °C ausgeführt wird.
18. Verfahren nach einem der vorangehenden Ansprüche, wobei die Zugabe der geeigneten Vorstufe 24
40 bis 48 Stunden nach Beginn der Fermentation durchgeführt wird.
19. Verfahren nach den Ansprüchen 1 bis 18, dadurch gekennzeichnet, daß die Zugabe eine wirksame Menge einer Vorstufe oder eines Derivats von Buttersäure in Zusammenhang mit der geeigneten Vorstufe von A/16686-Faktor A₂ oder A₃ erfolgt.
45
20. Verfahren zur Steigerung der Produktion eines Antibiotikum A/16686-Komplexes, umfassend die Zugabe einer wirksamen Menge einer Vorstufe oder eines Derivats von Buttersäure zu einer Kultur von Actinoplanes sp. ATCC 33076 oder einer produzierenden Mutante davon.

50 Revendications

1. Procédé de préparation d'un complexe antibiotique A/16686 enrichi en ses facteurs A₂ et/ou A₃ qui consiste à ajouter à une culture d'Actinoplanes sp. ATCC 33076 ou à l'un de ses mutants producteurs de l'antibiotique A/16686 une quantité à efficacité sélective du précurseur approprié, le précurseur
55 approprié permettant d'augmenter la proportion du facteur A₂ dans le complexe antibiotique A/16686 étant choisi parmi la leucine, ses sels avec des acides et des bases qui ne sont pas toxiques vis-à-vis du micro-organisme producteur, l'acide isovalérique, ses sels avec des bases qui ne sont pas toxiques vis-à-vis du micro-organisme producteur, ses esters avec des mono- et polyalcanols inférieurs, l'acide

- alpha-céto-isocaproïque, ses sels avec des bases qui ne sont pas toxiques vis-à-vis du micro-organisme producteur, ses esters avec des mono- et polyalcanols inférieurs, l'alcool isoamylique et ses esters avec des acides qui ne sont pas toxiques vis-à-vis du micro-organisme producteur, le précurseur permettant d'augmenter la proportion du facteur A₃ dans le complexe antibiotique A/16686 étant choisi
- 5 parmi la valine, ses sels avec des acides ou des bases qui ne sont pas toxiques vis-à-vis du micro-organisme producteur, l'acide alpha-céto-isovalérique, ses sels avec des bases qui ne sont pas toxiques vis-à-vis du micro-organisme producteur, ses esters avec des mono- et polyalcanols inférieurs, l'acide isobutyrique, ses sels avec des bases qui ne sont pas toxiques vis-à-vis du micro-organisme producteur, ses esters avec des mono- et polyalcanols inférieurs, l'isobutanol et ses esters
- 10 avec des acides qui ne sont pas toxiques vis-à-vis du micro-organisme producteur.
2. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est la valine ou ses sels avec des acides et bases non toxiques vis-à-vis du micro-organisme, sa quantité à efficacité sélective étant comprise entre 0,2 g/litre et 5g/litre et g/litre de préférence entre 0,5 g/litre et 4 g/litre.
 - 15 3. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est l'acide isobutyrique ou ses sels avec des bases non toxiques vis-à-vis du micro-organisme, sa quantité à efficacité sélective étant comprise entre 0,1 g/litre et 2,5 g/litre et de préférence entre 0,3 g/litre et 1,5 g/litre.
 - 20 4. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est un ester de l'acide isobutyrique et d'un mono- ou polyalcanol inférieur, sa quantité à efficacité sélective étant comprise entre 0,1 g/litre et 5 g/litre et de préférence entre 0,1 g/litre et 1 g/litre.
 - 25 5. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est l'isobutanol ou ses esters avec des acides non toxiques vis-à-vis du micro-organisme, sa quantité à efficacité sélective étant comprise entre 0,5 g/litre et 5 g/litre et de préférence entre 1 g/litre et 2 g/litre.
 - 30 6. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est la leucine ou ses sels avec des acides ou des bases non toxiques vis-à-vis du micro-organisme, sa quantité à efficacité sélective étant comprise entre 0,2 g/litre et 5 g/litre et de préférence entre 0,5 g/litre et 4 g/litre.
 - 35 7. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est l'acide isovalérique ou ses sels avec des bases non toxiques vis-à-vis du micro-organisme, sa quantité à efficacité sélective étant comprise entre 0,1 g/litre et 2,5 g/litre et de préférence entre 0,3 g/litre et 1,5 g/litre.
 8. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est un ester de l'acide isovalérique et d'un mono- ou d'un polyalcanol inférieur, sa quantité à efficacité sélective étant comprise entre 0,1 g/litre et 5 g/litre et de préférence entre 0,1 g/litre et 1 g/litre.
 - 40 9. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est l'alcool isoamylique ou l'un de ses esters avec des acides non toxiques vis-à-vis du micro-organisme, sa quantité à efficacité sélective étant comprise entre 0,5 g/litre et 5 g/litre et de préférence entre 1 g/litre et 2 g/litre.
 - 45 10. Procédé selon la revendication 1, dans lequel le précurseur approprié ajouté est l'acide alpha-céto-isocaproïque, ses sels avec des bases non toxiques vis-à-vis du micro-organisme, ou ses esters avec des mono- ou polyalcanols inférieurs, sa quantité à efficacité sélective étant comprise entre 0,2 g/litre et 5 g/litre et de préférence entre 0,5 g/litre et 4 g/litre.
 - 50 11. Procédé selon la revendication 1, 2, 3, 6, 7 ou 10, dans lequel les sels avec des bases non toxiques vis-à-vis du micro-organisme sont des sels de sodium ou d'ammonium.
 12. Procédé selon la revendication 1, 4, 8 ou 10, dans lequel l'ester est un ester de l'un des alcanols suivants : méthanol, éthanol, propanol, éthylèneglycol et glycérol.
 - 55 13. Procédé selon la revendication 1, 2 ou 6 dans lequel l'acide aminé se présente sous forme L.
 14. Procédé selon la revendication 1, 2 ou 6 dans lequel le sel avec un acide non toxique vis-à-vis du micro-organisme est le chlorhydrate ou le sulfate.

15. Procédé selon l'une quelconque des revendications 1, 5 et 9, dans lequel l'ester avec un acide non toxique vis-à-vis du micro-organisme est un ester d'un des acides suivants : acide acétique, acide propionique et acide butyrique.
- 5 16. Procédé selon l'une quelconque des revendications précédentes, dans lequel la souche est Actinoplanes sp. ATCC 33076.
17. Procédé selon l'une quelconque des revendications précédentes, dans lequel la fermentation est mise en oeuvre à une température de 25 °C à 35 °C et de préférence de 27 °C à 33 °C.
- 10 18. Procédé selon l'une quelconque des revendications précédentes, dans lequel l'addition du précurseur approprié est effectuée 24 à 48 heures après le début de la fermentation.
- 15 19. Dans un procédé selon les revendications 1 à 18, le perfectionnement supplémentaire consistant à ajouter une quantité efficace d'un précurseur ou d'un dérivé de l'acide butanoïque conjointement au précurseur proprement dit du facteur A₂ ou A₃ de l'antibiotique A/16686.
- 20 20. Procédé pour augmenter la production du complexe antibiotique A/16686, qui consiste à ajouter, à une culture d'un Actinoplanes sp. ATCC 33076 ou de l'un de ses mutants producteurs, une quantité efficace d'un précurseur ou d'un dérivé de l'acide butanoïque.
